Received June 14, 2007

Palladium-catalyzed coupling reactions of 6,6'-dihydroxyboron-2,2'-dimethoxy-1,1'-binaphthyl $\mathbf{5g}$ and chloroarenetricarbonylchromium complexes $\mathbf{6a-c}$ afforded complexes $\mathbf{7a-c}$ with the binaphthyl residue directly linked to the (η^6 -arene)tricarbonylchromium entity. Coupling reactions of 2,2'-dimethoxy, 3,3'-diodo, and 6,6'-diodo-1,1'-binaphthyl $\mathbf{3h}$ and $\mathbf{5h}$ with ethynylarenetricarbonylchromium derivatives $\mathbf{6d-f}$ and ethynylferrocene $\mathbf{9}$ yielded binaphthyl compounds linked to arenetricarbonylchromium and ferrocenyl derivatives $\mathbf{8a-c}$, $\mathbf{11a-c}$, $\mathbf{10}$, and $\mathbf{12}$ through a triple bond. Condensation of 2,2'-dimethylmethoxy, 3-formyl, 1,1'-binaphthyl $\mathbf{2a}$ with (η^6 -phenyl)methyltriphenylphosphonium tricarbonylchromium $\mathbf{13}$ and ferrocenylmethyltriphenylphosphonium $\mathbf{18}$ gave binaphthyl compounds linked to arenetricarbonylchromium and ferrocenyl derivatives $\mathbf{14}$ and $\mathbf{19}$, respectively, through a double bond. X-ray analyses of the dinuclear chromium complex $\mathbf{8a}$ and of the mononuclear chromium complex $\mathbf{17-Z}$ are described.

Introduction

Carbon-bridged bimetallic π -conjugated complexes have attracted considerable interest due to their physical and chemical properties leading to potential application as a material with nonlinear optical properties. In our laboratory, we have prepared such complexes by creating C–C bonds via different methodologies associating organic derivatives and η^5 - and η^6 -organometallic complexes. Being involved in organometallic complexes and recently in 2,2'-dimethoxy-1,1'-binaphthyl compounds, we combined the two experiences to prepare binapthyl derivatives associated with arenetricarbonylchromium and ferrocene

complexes.^{4,5c} Our final goal was to associate chiral ortho or meta disubstituted-arenetricarbonylchromium complexes with helicoïdal binaphthyl residues and to know if the combination of the planar and helicoïdal chiralities could enhance NLO activities. To our knowledge, only a few examples of binaphthyl derivatives substituted by organometallic complexes have been described in the literature. One implied cationic diiron complexes obtained by condensation of ortho monoaldehyde 1a and dialdehyde 3a and the cationic dinuclear complex $[Fe_2(\eta^5 C_5H_5)_2(CO)_2(\mu\text{-CO})(\mu\text{-C-CH}_3)]^+[BF_4]^{-,5a}$ another one concerned the benzannulation of axial chiral biscarbene complexes of Cr,5b and a third one involved the combination of planar chirality and axial chirality by reaction of (S)-2-amino-2'methoxy-1,1'-binaphthyl with the (S)- or (R)-ferrocenylpropenal. Here, we report efficient syntheses of $(\eta^6$ -arene)tricarbonylchromium and ferrocene complexes linked to 2,2'-dialkoxy-1,1'binaphthyl derivatives either directly or through different spacers such as a triple or a double bond.

Results and Discussion

The general strategy for the preparation of arenetricarbonylchromium or ferrocene derivatives linked to binaphthyl compounds was based on palladium-catalyzed coupling reactions such as Stille, Negishi, or Sonogashira reactions. Thus, we

synthesized three series of compounds depending on the nature of the link between the binaphthyl residue and the organometallic entity: complexes 3e, 7a-c where the binaphthyl is directly linked to the arenetricarbonylchromium derivatives, complexes 8a-d, 10, 11a-c, and 12 in which the spacer is a triple bond, and complexes 14-17 and 19 in which the spacer is a double bond.

Synthesis of the Starting Binaphthyl Derivatives. Racemic 2,2'-dihydroxy-1,1'-binaphthyl (BINOL) treated with NaH and MeI yielded the dimethoxy compound 3b.6 ortho-Lithiation of the diether gave the 2,2'-dilithio compound 3c,3c which was trapped with DMF, Br₂, I₂, ClSnBu₃, and B(OEt)₃ to yield the dialdehyde 3a⁷ (71% yield), the dibromo 3d (30% yield), the diodo 3h (33% yield), the stannous derivative 3f (38% yield), and the diboronic acid 3g (37% yield), Scheme 1. Depending on the experimental conditions, the monoaldehyde 1a and the monobromo derivative 1d have been also recovered as byproducts. We prepared compound 2b, which appeared to be more soluble in organic solvents in contrast to 1b, by protecting the hydroxy groups of BINOL with a methyl methoxy group (MOM).8 The choice of the protected methoxy methyl ether MOM group was dictated not only by a solubility problem, but also by the monolithiation/formylation sequence. Indeed, lithiation of 1b required 3 equiv of n-BuLi, whereas lithiation of 2b occurred with only 1 equiv of n-BuLi. DMF trapping gave the monoaldehyde 2a in 60% yield together with the dialdehyde 4a in 22% yield. Thus, 2b was lithiated with n-BuLi into 2c and trapped with I₂, giving the monoiodo compound **2h** in 49%

Direct Link between the Binaphthyl Derivatives and the Arenetricarbonylchromium Complexes: Synthesis of 3e, 7a-c. We were first interested to test the addition of an organometallic moiety at the 3 or at the 3,3′ positions of the binaphthyl framework. Stille arylation of the bromo derivative 3d and tributyltinbenzenetricarbonylchromium⁹ failed to afford

Scheme 2. Synthesis of the Dinuclear Complex 3e

complex 3e efficiently. Alternatively, condensation of the tin derivative $3f^9$ and bromobenzenetricarbonylchromium 10 was undertaken, but it was revealed to be also unsuccessful. Suzuki arylation of chlorobenzenetricarbonylchromium $6a^{10}$ with the boronic acid 3g in the presence of $Pd(PPh_3)_4$ and $Ba(OH)_2$ as a base gave a mixture of compounds, but the expected complex 3e was obtained as a minor product, Scheme 2. If K_2CO_3 was used as a base and if the reaction mixture was performed in acetone, complex 3e was obtained in only 28% yield and was shown to be very unstable. We tried also to perform *ipso* nucleophilic aromatic substitution S_NAr^{11} with fluorobenzenetricarbonylchromium 12 and the bis(naphthyllithium) derivative 3e. Unfortunately, we recovered the starting material probably because the protons *ortho* to the fluoro group were too acidic and likely lithiated by 3e and then hydrolyzed.

In view of these results, we investigated what could be the influence of steric hindrance of the boronic derivative on the course of the reaction by performing the reaction on a less hindered carbon. Consequently, we repeated an analogous experiment starting from the less crowded boronic acid at the C6 carbon **5g**. Thus, in the presence of Pd(PPh₃)₄, Na₂CO₃, and chloroderivatives **6a**-**c**, ^{13e} we successfully obtained the corresponding binaphthyl derivatives 7a-c directly substituted by $(\eta^6$ -arene)Cr(CO)₃ entities in 71%, 72%, and 74% yield, respectively, Scheme 3. A well-resolved ¹H NMR spectrum of the *ortho* derivative **7b** was obtained. Indeed, the four protons H_{13} , H_{14} , H_{15} , and H_{16} of the η^6 complex resonate at 5.18, 5.50, 5.18, and 5.62 ppm, respectively, in agreement with a major conformation of the Cr(CO)₃ tripod¹³ in solution eclipsing the C_{12} carbon bearing the methyl group and the C_{14} and C_{16} carbons. The differences of chemical shift $\delta(H_{14}) - \delta(H_{13}) =$ 0.32 and $\delta(H_{16}) - \delta(H_{15}) = 0.44$ ppm are noticeable, Table 1. No conclusion can be drawn for the major conformation of the tripod Cr(CO)₃ in solution for complexes 7a and 7c. For the naphthyl part, the five aromatic protons H₃, H₄, H₆, H₈, and H₉ resonate almost at the same frequencies for complexes 7a and

7c; however, the two protons H_6 and H_8 of complex 7b are unexpectedly shielded, Table 1. According to these results, we can assume that it is likely that the C3 and C3′ positions of the binaphthyl moiety were not reactive for a direct substitution by an arenetricarbonylchromium complex for steric reasons. Thus, we tried to link these two parts through a spacer, a triple or a double bond. The corresponding results are summarized next.

Binaphthyl Derivatives Linked to Arenetricarbonylchromium and Ferrocene Complexes through a Triple Bond: Synthesis of 8a-d, 10, 11a-c, and 12. Our first trial concerned the introduction of a triple bond between the naphthyl ring and the organometallic part by condensing the dibromo compound 3d and ethynylarenetricarbonyl chromium 6d^{2c,d} using PdCl₂(PPh₃)₂, CuI, Et₃N, THF or Pd₂(dba)₃, AsPh₃, Et₃N, THF at 40 °C, but this did not yield the expected chromium complex 8a, Scheme 4. Repeating these condensations with the diiodo compounds 3h and the alkyne 6d, we obtained complex 8a in 55% yield with PdCl₂ (PPh₃)₂, CuI, Et₃N, and THF and in 74% yield with Pd₂dba₃, AsPh₃ without CuI. This reaction has been generalized with ortho and meta ethynyltoluenetricarbonylchromium complexes 6e and 6f, which lead to the formation of the di-substituted complexes 8b and 8c in 60% and 90% yield, respectively, as diastereoisomer mixtures, Scheme 4.

Alternatively, complex **8a** was also obtained by condensing 3,3'-diethynyl-binaphthyl compound **3j** with chlorobenzenetri-

carbonylchromium complex **6a**. For this purpose, we reacted the diodo compound **3h** with trimethysilylacetylene, which afforded the trimethylsilylethynyl compound **3i** in 62% yield in the presence of PdCl₂(PPh₃)₂, CuI, and Et₃N. Cleavage of the C-Si bond with NaOH, 2 N in MeOH occurred almost in quantitative yield giving complex **3j**. ^{2a,10b} Next, coupling reaction using Pd₂(dba)₃, AsPh₃, Et₃N with chlorobenzenetricarbonylchromium **6a** and **3j** in THF (reflux 5h) yielded complex **8a** in 49% yield, Scheme 4. The reaction with the organometallic entity bearing the triple bond is slightly more efficient than the one involving the binaphthyl residue substituted by the triple bond. The yield of the coupling reaction was improved by using the diiodo derivative **4h**, which, heated with the alkyne **6d** in the presence of Pd₂dba₃, AsPh₃ for 5 h, gave complex **8d** in 80% yield.

Crystals of 3,3'-(ethynylbenzenetricarbonylchromium), 2,2'dimethoxy, and 1,1'-binaphthyl 8a suitable for X-ray analysis were obtained from a solution of the complex in a petroleum ether/acetone mixture. CAMERON views and some selected bond lengths are presented in Figures 1-3, and crystal data are reported in Table 2. Three important features can be emphasized. First, the neutral complex displays the well-known piano-stool conformation found in half-sandwich tricarbonyl complexes. ^{2a,d,e} The conformations adopted by the Cr(CO)₃ entities with respect to the aromatic carbons of the rings are unexpectedly different for each half of the molecule. One is a staggered conformation of the tripod with dihedral angles O₂·Cr₁·CtC₁₁·, O₃·Cr₁·CtC₁₅·, and O1'Cr1'CtC13' of 26°, 28°, and 31°, respectively, for the tripod coordinated to the C₁₁'-C₁₆' carbons, Ct being the center of the six-membered ring, Figure 2, whereas the other one is an almost eclipsed conformation with dihedral angles O21Cr1-CtC₁₁, O₂₃Cr₁CtC₁₃, and O₂₂Cr₁CtC₁₅ of 6°, 14°, and 18°, respectively, Figure 1. These differences are probably due to crystal packing effects. It is worthy to note that these two conformations are associated with two opposite orientations of

Selected bond lengths (Å): Cr_1C_{11} 2.177(9); Cr_1C_{12} 2.191(11); Cr_1C_{13} 2.199(12); Cr_1C_{14} 2.182(11); Cr_1C_{15} 2.172(11); Cr_1C_{16} 2.192(10); $C_{11}C_{12}$ 1.385(14); $C_{12}C_{13}$ 1.412(16); $C_{13}C_{14}$ 1.368(16); $C_{14}C_{15}$ 1.377(15); $C_{15}C_{16}$ 1.398-(15); $C_{16}C_{11}$ 1.398(13).

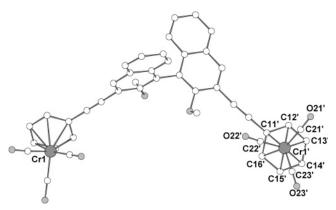

Figure 2. CAMERON views of complex **8a** with the $Cr_{1'}(CO)_3$ tripod projected onto the second arene ring. Selected bond lengths (Å): $Cr_{1'}C_{11'}$ 2.212(8); $Cr_{1'}C_{12'}$ 2.199(8); $Cr_{1'}C_{13'}$ 2.200(9); $Cr_{1'}C_{14'}$ 2.210(10); $Cr_{1'}C_{15'}$ 2.229(8); $Cr_{1'}C_{16'}$ 2.238(8); $C_{11'}C_{12'}$ 1.393(11); $C_{12'}C_{13'}$ 1.414(12); $C_{13'}C_{14'}$ 1.393(13); $C_{14'}C_{15'}$ 1.392(12); $C_{15'}C_{16'}$ 1.412(11); $C_{16'}C_{11'}$ 1.433(11).

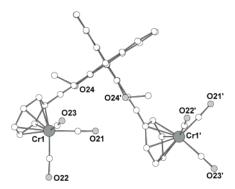

Figure 3. Dihedral angle between the two binaphthyl planes and proximal and distal positions of the MeO groups of complex **8a**.

the methoxy groups of the binaphthyl residue as clearly shown in Figure 3. Indeed, the tripod $Cr(CO)_3$, which is almost eclipsed by the C_{11} , C_{13} , and C_{15} carbon atoms of the arene ring, is associated with a distal methoxy group *anti* to the first Cr atom, and the almost staggered tripod $Cr(CO)_3$ is associated with a proximal methoxy group *syn* to the second Cr atom. Second, the bond lengths of the Cr_1 and the $Cr_{1'}$ atoms to the aromatic carbons have almost the same mean value, 2.185(11) Å (range 2.152–2.218) and 2.215(11) Å (range 2.182–2.248), respectively. The dihedral angle between the naphthyl planes is 88° as expected, Figure 3. This view clearly shows the proximal and distal positions of the methyl of the methoxy groups. Finally,

Scheme 5. Synthesis of the Dinuclear Complex 10

we noticed some $\pi-\pi$ stacking between two naphthyl groups of two different molecules. A distance of 3.4 Å was observed between one naphthyl group of a molecule parallel to another naphthyl group of another molecule. The dihedral angle of the plane of the metal-coordinated arene ring and the corresponding naphthyl moiety is 29° for the complex bearing the Cr_1 and 30° for the complex bearing the Cr_{31} atom.

Condensation of the diodo compound **3h** with ethynylferrocene¹⁴ **9** under the same experimental conditions as those used for the formation of **8d** afforded the bis-ferrocenyl complex **10** in 80% yield, Scheme 5. We generalized these reactions with the halogenated binaphthyl derivatives substituted at the C₆ position. We first tried to react the dibromo compound **5d** with ethynylbenzenetricarbonylchromium **6d**^{2d,10} and PdCl₂(PPh₃)₂, CuI, and Et₃N but without any success. Next, we tested the diiodo compound **5h** obtained in 97% yield by lithiation of **5d** with *n*-BuLi at 78 °C and then by treatment with I₂. Sonogashira coupling in the presence of CuI, PdCl₂(PPh₃)₂, and NEt₃ with **6d** afforded the expected yellow complex **11a** in 64% yield, confirming the much stronger reactivity of the iodo derivatives

Scheme 6. Synthesis of the Dinuclear Complexes 11

Scheme 7. Synthesis of the Dinuclear Complexes 12

Scheme 8. Synthesis of the Dinuclear Complex 14

in both C3- and C6-substituted series, Scheme 6. We extended this reaction by using *ortho* and *meta* methylethynylbenzenetricarbonylchromium complexes **6e,f** and recovered complexes **11b** and **11c** in 57% and 43% yield, respectively, as orange yellow and yellow compounds, Scheme 6. Alternatively, we reacted the 6,6'-bis-ethynylbinaphthyl compound **5k** and chlorobenzenetricarbonylchromium **6a** with a catalytic amount of PdCl₂(PPh₃)₂ and CuI, in the presence of NEt₃ to form **11a**, but the less satisfying yield 43% than the preceding one 64% obtained with the triple bond linked to the organometallic partner was in good agreement with the results obtained for the C₃-substituted complex **8a**. Under the same conditions as the ones used for the formation of **10**, ethynylferrocene **9** and the 6,6'-diodo compound **5h** gave the bimetallic iron complex **12** in 69% yield, Scheme 7.

Binaphthyl Derivatives and Arenetricarbonylchromium and Ferrocene Complexes Linked through a Double Bond: Synthesis of 14–17 and 19. The choice of a double bond as a spacer was dictated for a synthetic point of view but also by the pioneering work of Green¹⁵ and Marder et al., ¹⁶ showing interesting properties of a (Z)-1-ferrocenyl-2-(4 nitrobenzene)-ethylene crystal and of the iodide of a cationic complex of (E)-1-ferrocenyl-2-(4 pyridinium) ethylene, respectively. Thus, we prepared first the η^6 -(benzyl)tricarbonylchromiumtri-

phenylphosphonium bromide 13^{18b} in 68% yield by treating the tricarbonylchromium complex of benzylic alcohol¹⁰ with PPh₃, HBr¹⁷ in THF in the presence of 4 Å molecular sieves.

Condensation of the ylide generated by treating the phosphonium 13 with 'BuOK¹⁸ and the dialdehyde 3a^{7a} in refluxing THF for 4 h afforded three products 14, 15, and 16 in 44%, 33%, and 13% yield, respectively, Scheme 8. Unexpectedly, the Z dinuclear complex 14 was not contaminated by the Econformer. The two olefinic protons H₁₇ and H₁₈ of complex **14** resonate at 7.03 and 6.33 ppm, and the five aromatic protons of the ring coordinated to the Cr(CO)₃ fragment exhibit two signals at 5.33 (H₁₃ H₁₄ H₁₅, m) and at 5.47 ppm (H₁₂ H₁₆, d). The monoaldehyde 15 corresponded to the condensation of only one ylide to the dialdehyde 3a, and compound 16 was probably recovered by decomplexation by light and (or) air of one of the arene rings of 14. The chemical shifts of the two sets of olefinic protons of complex 16 are interesting to compare. Indeed, for the double bond linked to the arenetricarbonylchromium complex, the chemical shifts of the H₁₇ and H₁₈ protons are 6.33 and 7.03 ppm, J = 12 Hz, chemical shifts similar to the values noted for complex 14. Yet for the other double bond conjugated to the phenyl ring, a large 0.47 ppm deshielding was observed for the α proton at 6.80 ppm and a small 0.09 ppm deshielding

Figure 5. CAMERON view of complex **17-Z** showing the dihedral angle between the binaphthyl groups.

Scheme 9. Synthesis of the Mononuclear Complex 17

for the β proton at 6.95 ppm, corresponding to a more electronrich olefin due to the decoordination of the Cr(CO)₃ entity.

To selectively synthesize a binaphthyl complex monosubstituted by the styrene chromium derivative, we chose the monoaldehyde 2a¹⁹ as the starting material, taking advantage of its easy and selective formation from the diether 2b. We reacted the ylide of 13 with the aldehyde 2a and obtained the Z and E olefins 17-E and 17-Z in 15% and 66% yield, respectively, Scheme 9. Toluenetricarbonylchromium complex was recovered as a byproduct in 3% yield and characterized by NMR spectroscopy.²⁰ Its formation can be explained by hydrolysis of the phosphorus hydroxide ArCr(CO)₃CH₂Ph₃P-OH into Ph₃P=O and the benzylic carbanion, which is protonated into the toluene Cr complex. The Z and the E isomers could be separated by silica gel chromatography column as yellow and orange compounds. The last more intense color might be explained by the conjugation of the π -system of the E isomer probably being better than the one for the Z isomer.

Scheme 10. Synthesis of the Mononuclear Complex 19

 1 H NMR data confirm the Z and E nature of the double bonds. Indeed, the Z ethylenic protons resonate at 6.36 and 7.06 ppm, J=12 Hz, whereas for the E isomer, one proton is found at 6.93 ppm, J=16 Hz, and the other one is hidden by the fingerprint of the naphthyl proton signal. The chemical shifts of H_{13} , H_{14} , H_{15} meta and para aromatic protons of the coordinated ring resonate as a multiplet at the same frequency 5.33 ppm, whereas H_{12} and H_{16} ortho protons show a doublet at 5.47 ppm, J=6 Hz. These data are in good agreement with an anti-eclipsed conformation of the tripod of the major conformer in solution with respect to the double bond. 13

Crystals of the isomer 17-Z were obtained by slow diffusion of petroleum-ether into an acetone solution of the complex, which confirmed the Z olefin configuration. Crystal data are reported in Table 2, and Figures 4 and 5 show CAMERON views of the complex along with some selected bond lengths. It is worthy to note a nearly anti-eclipsed conformation of the Cr(CO)₃ tripod with respect to the double bond in the solid state, the dihedral angles of the projected Cr-CO with respect to the aromatic carbon atoms being equal to 14-20°, Figure 4. The MOM group OCH₂OCH₃ adopts a position that avoids interactions with the arenetricarbonylchromium part. The bond lengths $Cr-C_i$ (i = 11-16) between the Cr atom and the carbons of the coordinated ring are almost equal, mean value 2.213(11) Å. The length of the double bond is 1.324(14) Å. Furthermore, the dihedral angle between the arene bearing the chromium entity and the corresponding binaphthyl entity is 115.2°. These two features rule out a strong conjugation between the two aromatic parts in the solid state. We observed an unexpected small dihedral angle between the naphthyl groups of 78°, Figure 5, and some $\pi - \pi$ stacking between naphthyl groups of two molecules lying at 3.6 Å.

For the E isomer, the H_{12} , H_{13} , and H_{14} protons resonate at frequencies that are much more differentiated than the ones in the Z isomer. Indeed, the H_{12} , H_{16} protons resonate at 5.67 ppm, d, J=6 Hz, whereas the $H_{13}H_{15}$ and H_{14} protons resonate at 5.50, t, J=6 Hz and 5.36 ppm, t, J=6 Hz, respectively.

Finally, we undertook a Wittig reaction between the ferrocenyl ylide²¹ of **18** and the monoaldehyde **2a**, which afforded the mononuclear iron complex **19** (Table 3) in 45% yield. The Z isomer was the major isomer, the ratio E:Z being 1:3, Scheme 10. We recovered also methylferrocene as a byproduct (5%) whose formation can be explained with the same mechanism as the one involved for toluenetricarbonylchromium complex formation vide supra.

Conclusion

We have developed an efficient strategy to substitute binaphthyl derivatives with (η^6 -arene)tricarbonylchromium and ferrocene complexes. Thus, palladium-catalyzed coupling of 3,3' and 6,6'-boronic acid-2,2'-dialkoxy-1,1'-binaphthtyl and chloroarenetricarbonylchromium derivatives yielded (η^6 -arene)-

tricarbonylchromium complexes directly linked to the binaphthyl residue. Coupling reactions of 3,3' and 6,6'-diiodo-2,2'-dialkoxy-1,1'-binaphthtyl derivatives with ethynylarenetricarbonylchromium and ethynylferrocene complexes yielded (η^6 -arene)tricarbonylchromium and ferrocene complexes linked to binaphthyl derivatives via a triple bond. Similarly, condensing methyltriphenylphosphonium bromide of arenetricarbonylchromium and ferrocene with binaphthylaldehydes afforded complexes with a double bond as spacer. X-ray analyses of two chromium complexes with a double and a triple bond as spacers were also presented, showing clearly the conformations of the tricarbonyl tripods with respect to the aromatic rings.

Experimental Section

General Procedures. All reactions and manipulations were routinely performed under a dry nitrogen atmosphere using Schlenk tube techniques. THF and diethyl ether were dried over sodium benzophenone ketyl and distilled. CH₂Cl₂ was dried over calcium hydride and distilled. Infrared spectra were measured on a Perkin-Elmer 1420 spectrometer. ¹H, ³¹P{¹H}, and ¹³C{¹H} NMR spectra were obtained on a Bruker AC200, ARX400, or DRX500 spectrometer. Elemental analyses were performed by Le Service de Microanalyses de l'Université Pierre et Marie Curie.

Synthesis of 2,2'-Dimethoxy-3- η^6 -(phenyltricarbonylchromium)-1,1'-binaphthyl (3e). 2,2'-Dimethoxy-1,1'-binaphthyl-3,3'-boronic acid, 3g (0.2 g; 0.50 mmol), chlorobenzene tricarbonylechromium (0.273 g; 1.1 mmol), K₂CO₃ (0.207 g; 1.5 mmol), and Pd(PPh₃)₄ (0.029 g; 0.025 mmol) in 15 mL of acetone were introduced in a flask under N2. The reaction mixture was heated for 21 h under reflux and filtered on Celite. After evaporation of the solvents, the crude mixture was purified by silica gel $15-40 \mu m$ chromatography column (petroleum ether/Et₂O: 6/4, 300 mL then PE/Et₂O: 4/6). Complex 3e (0.105 g) was obtained as an orange solid in 28% yield. ¹H NMR (200 MHz, CDCl₃): 3.18 (s, 6H, H₁₅), 5.60 (m, 4H, H₁₀, H₁₄), 6.01 (m, 6H, H₁₁, H₁₂, H₁₃), 7.27-7.41-7.75-7.99 (m, 8H, H₅, H_6 , H_7 , H_8), 8.11 (s, 2H, H_4). IR (neat, cm $^{-1}$): 1863, 1956 (CO). Anal. Calcd for $C_{40}H_{26}Cr_2O_8$: C, 65.04; H, 3.55. Found: C, 65.21; H, 3.61. MS (FAB m/z): calcd, 738.0; found, 738.0 (M⁺).

Synthesis of o-Ethynyltoluene Tricarbonylchromium (6e). In a flask, 2-chlorotoluenetricarbonylchromium (0.610 g, 2.32 mmol), CuI (0.023 g, 0.012 mmol), and PdCl₂(PPh₃)₂ (0.085 g, 0.012 mmol) were dissolved in 20 mL of THF and 10 mL of Et₃N. At room temperature, ethynyltrimethylsilane (0.50 mL, 3.52 mmol) in 10 mL of THF was slowly added. The resulting mixture was then refluxed for 6 h. After being cooled, the dark solution was filtered through Celite, and the solvents were evaporated under reduced pressure. The orange oil was purified by a silica gel chromatography column (15–40 μ m, eluant EP/Et₂O: 96/4). The silylated complex 6e, R:CC-SiMe₃, was obtained as an orange solid in 99% yield (0.745 g). ¹H NMR (200 MHz, CDCl₃): 0.16 (s, 9H, H₁₀), 2.22 (s,

3H, H₇), 5.05 (td, J = 6.2 Hz, J = 1.0 Hz, 1H, H₅), 5.11 (d, J =6.2 Hz, 1H, H₆), 5.24 (td, J = 6.2 Hz, J = 1.0 Hz, 1H, H₄), 5.49 (d, J = 6.2 Hz, 1H, H₃). ¹³C NMR (50 MHz, CDCl₃): 0.0 (C₁₀), 19.9 (C₇), 88.9 (C₆), 89.6 (C₉), 91.9 (C₈), 92.3–96.5 (C₄, C₅), 98.4 (C₃), 99.6 (C₁), 110.6 (C₂), 232.4 (CO). Anal. Calcd for C₁₅H₁₆-CrO₃Si: C, 55.55; H, 4.98. Found: C, 55.71; H, 5.03. The silylated complex (3.02 g, 9.7 mmol) was dissolved in 60 mL of methanol. A 2 N aqueous solution of sodium hydroxide (10.7 mL, 21.3 mmol) was added, and the mixture was stirred for 3 h. After 30 mL of water was added, the solution was extracted with 3×50 mL of diethyl ether. The organic layers were dried over anhydrous magnesium sulfate, filtered through Celite, and the solvents were evaporated under reduced pressure. Compound 6e was purified by a short silica gel chromatography column (15-40 μ m, eluant EP/ Et₂O: 96/4) and obtained as a yellow solid in 87% yield (2.13 g). F = 80 °C. ¹H NMR (200 MHz, CDCl₃): 2.25 (s, 3H, H₇), 3.00 (s, 1H, H₉), 5.05 (dd, J = 6.0 Hz, J = 0.9 Hz, 1H, H₆), 5.10 (t, J $= 6.0 \text{ Hz}, 1\text{H}, \text{H}_5), 5.30 \text{ (td}, J = 6.0 \text{ Hz}, J = 0.9 \text{ Hz}, 1\text{H}, \text{H}_4), 5.55$ (dd, J = 6.0 Hz, J = 0.9 Hz, 1H, H₃). ¹³C NMR (50 MHz, CDCl₃): 19.8 (C₇), 78.6 (C₉), 80.1 (C₁), 87.9 (C₈), 88.7-91.7-93.0-96.9 (C₃, C₄, C₅, C₆), 111.1 (C₂), 232.1 (CO). Synthesis of 6,6'-Di(3-methylphenyltricarbonylchromium)-2,2'-dimethoxy-1,1'-binaphthyl (7c). Compound 7c was synthesized using the same methodology as 7a starting from 3-chlorotoluene tricarbonylchromium (0.288 g, 1.1 mmol). It was obtained as a yellow solid in 72% yield (276 mg). $F_{\text{dec}} = 167 \,^{\circ}\text{C}$. ¹H NMR (200 MHz, CDCl₃): 2.29 (s, 6H, H₁₇), 3.79 (s, 6H, OMe), 5.17 (d, $J = 3 \text{ Hz}, 2H, H_{12}, 5.58 \text{ (m, 6H, } H_{14}, H_{15}, H_{16}), 7.13 \text{ (d, } J = 9 \text{ Hz,}$ 2H, H₉), 7.33 (d, J = 9 Hz, 2H, H₈), 7.49 (d, J = 9 Hz, 2H, H₃), 8.01 (s, 2H, H₆), 8.02 (d, J = 9 Hz, 2H, H₄). ¹³C NMR (100 MHz, CDCl₃): 20.9 (C₁₇), 56.7 (OMe), 89.3 (C₁₆), 91.4 (C₁₂), 92.7 (C₁₅), 94.1 (C₁₄), 114.7 (C₃), 125.3 (C₉), 125.8 (C₈), 126.6 (C₄), 130.0 (C₆), 155.7 (C₂), 233.3 (CO), 109.2, 112.1 (C₁₁, C₁₃), 118.9, 128.6, 131.4, 133.9 (C₁, C₅, C₇, C₁₀). IR (neat, cm⁻¹): 1951, 1860 (CO). UV-vis (CH₃CN) $\lambda = 273$ nm, $\epsilon = 60000$, $\lambda = 321$ nm, $\epsilon =$ 29 400 L mol⁻¹ cm⁻¹; (CH₂Cl₂) $\lambda = 274$ nm, $\epsilon = 73$ 700 L mol⁻¹ cm⁻¹. Anal. Calcd for $C_{42}H_{30}Cr_2O_8$: C, 65.80; H, 3.94. Found: C, 65.91; H, 4.01.

Synthesis of 2,2'-Dimethoxy-3,3'-di(phenylethynyltricarbonyl**chromium**)-1,1'-binaphthyl (8a). In a flask, compound 3h (0.283 g, 0.50 mmol) and complex $6d^{2\text{c,d}}$ (0.262 g, 1.1 mmol), Pd_2dba_3 (0.023 g, 0.025 mmol), and AsPh₃ (0.023 g, 0.075 mmol) were dissolved in 15 mL of Et₃N distilled and kept over KOH. The mixture was heated at 40 °C for 6 h. The dark solution was then filtered trough Celite at room temperature, and the solvent was evaporated under reduced pressure. Compound 8a was purified by silica gel chromatography column (15–40 μm, eluant EP/Et₂O: 6/4, 300 mL and then 4/6) and obtained as an orange solid in 74% yield $(0.291 \text{ g}). F = 210 \,^{\circ}\text{C}. \,^{1}\text{H NMR} (200 \text{ MHz}, \text{CDCl}_{3}): 3.65 (\text{s}, 6\text{H},$ H₁₉), 5.34 (m, 6H, H₁₃, H₁₄, H₁₅), 5.60 (m, 4H, H₁₂, H₁₆), 7.10 (d, $J = 8.0 \text{ Hz}, 2H, H_9$, 7.28 (td, ${}^{3}J = 8.0 \text{ Hz}, {}^{4}J = 1.3 \text{ Hz}, 2H, H_8$), 7.42 (td, ${}^{3}J = 8.0 \text{ Hz}$, ${}^{4}J = 1.3 \text{ Hz}$, 2H, H₇), 7.86 (d, ${}^{3}J = 8.0 \text{ Hz}$, 2H, H₆), 8.20 (s, 2H, H₄). ¹³C NMR (50 MHz, CDCl₃): 61.4 (C₁₉), 86.6-89.5-90.1 (C₁₁–C₁₇–C₁₈), 91.1 (C₁₄), 91.3 (C₁₂, C₁₆), 95.1 (C₁₃, C_{15}), 115.9 (C_1), 124.8 (C_3), 125.5 (C_7 , C_9), 127.7–127.9 (C_6 , C_8), 130.0 (C_{10}), 134.0 (C_5), 134.9 (C_4), 155.5 (C_7), 232.1 (C_7). Synthesis of 6,6'-Di(ferrocenylethynyl)-2,2'-dimethoxy-1,1'binaphthyl (12). In a 50 mL two-necked flask, compound 5h (0.283 g, 0.5 mmol), ethynylferrocene, 9 (0.252 g, 1.2 mmol), PdCl₂(PPh₃)₂ (0.018 g, 0.025 mmol), and CuI (0.005 g, 0.025 mmol) were placed in 15 mL of THF and 15 mL of Et₃N. The solution was then refluxed. After 3 h, the mixture was cooled to room temperature and filtered through Celite. The solvents were evaporated under reduced pressure. The residue was washed with a solution of K2-CO₃ to eliminate triethylammonium salts, and compound 12 was purified by crystallization in a hot mixture of CH₂Cl₂ and cyclohexane. It was obtained as a brown solid in 69% yield (252 mg). $F_{dec} = 161$ °C. ¹H NMR (200 MHz, CDCl₃): 3.77 (s, 6H, OMe), 4.23 (m, 14H, H₁₈, H₁₅, H₁₆), 4.51 (m, 4H, H₁₄, H₁₇), 7.03 $(d, J = 9 Hz, 2H, H_9), 7.26 (d, J = 9 Hz, 2H, H_8), 7.45 (d, J = 9 Hz, 2H, H_8)$ Hz, 2H, H₃), 7.93 (d, J = 9 Hz, 2H, H₄), 8.02 (d, J = 2 Hz, 2H, H₆). ¹³C NMR (100 MHz, CDCl₃): 56.7 (OMe), 65.5 (C₁₃), 68.7 $(C_{15},\,C_{16}),\,69.9\,(C_{18}),\,71.3\,(C_{14},\,C_{17}),\,86.2,\,88.0\,(C_{11},\,C_{12}),\,114.5$ (C₃), 125.1 (C₉), 128.9 (C₈), 129.3 (C₄), 131.0 (C₆), 155.4 (C₂). IR (neat, cm⁻¹): 2208 (C₁₁C₁₂). UV-visible (CH₂Cl₂) λ 273 (ϵ = 71 900 L mol⁻¹ cm⁻¹); λ 321 (ϵ = 44 300 L mol⁻¹ cm⁻¹); (CH₃-CN) λ 271 (ϵ = 75 700 L mol⁻¹ cm⁻¹); λ 321 (ϵ = 36 500 L mol⁻¹ $cm^{-1}). \ Anal. \ Calcd \ for \ C_{46}H_{34}Fe_2O_2: \ C, \ 75.64; \ H, \ 4.69. \ Found:$ C, 75.36; H, 4.47.

Synthesis of η^6 -(Benzyltricarbonylchromium)triphenyl**phosphonium Bromide** (13). In a flask equipped with a Dean-Stark apparatus, tricarbonylchromiumbenzylalcohol (0.448 g, 2.0 mmol) and triphenylphosphonium hydrobromide (0.618 g, 1.8 mmol) were dissolved in CH₂Cl₂ (30 mL) under N₂. The solution was refluxed for 2 h and heated until dryness over 30 min. The resulting solid was dissolved in CH₂Cl₂ (15 mL) and precipitated by adding dry diethyl ether (10 mL per amount until persistence of the yellow precipitate). After decanting, the liquid layer was removed with a syringe and the solid was washed twice with 10 mL of dry diethyl ether. After being dried under reduced pressure, compound 13 was obtained as a yellow solid in 68% yield (0.696 g). ¹H NMR (400 MHz, CDCl₃): 5.03 (d, J = 13 Hz, 2H, CH₂), 5.18 (s large, 3H, ArCr), 5.38 (s arge, 2H, ArCr), 7.71-7.83 (m, 15H, Ph). ¹³C NMR (100 MHz, CDCl₃): 59.4 (CH₂), 90.8 (C_{para}-ArCr), 91.5 (Cortho ArCr), 93.2 (Cméta ArCr), 97.8 (Cipso ArCr), 115.6 (d, J = 85 Hz, C_{ipso} Ph), 129.6 (d, J = 13 Hz, C_{meta} Ph), 133.5 (d, $J = 10 \text{ Hz}, C_{para}\text{Ph}), 134.7 \text{ (d, } J = 2.6 \text{ Hz}, C_{para}\text{Ph}), 230.8 \text{ (CO)}.$ ³¹P NMR (160 MHz, CDCl₃): 24.1. IR (neat): 1858, 1885, 1955 (CO). MS (MALDI-TOF, m/z): calcd for $C_{28}H_{22}CrO_3P^+$, 489; found, 489 (C⁺), 1058 (M + 1 + C⁺). Anal. Calcd for $C_{28}H_{22}$ -CrO₃PBr: C, 59.16; H, 3.90. Found: C, 59.01; H, 3.79.

Synthesis of 2,2'-Dimethoxy-3,3'- η^6 -(ethenylphenyltricarbonylchromium)-1,1'-binaphthyl (14). 3,3'-Diformyl-2,2'-dimethoxy-1,1'-binaphthyl^{7a} (0.129 g, 0.35 mmol) in THF (20 mL) and *t*-BuOK (0.77 mL, 0.77 mmol) were introduced into a flask under N₂ and stirred at room temperature for 1 h. Next, the phosphonium 13 (0.40 g, 0.77 mml) was added, and the orange solution was heated for 4 h under reflux. At room temperature, NH₄Cl (20 mL) and 10 mL of Et₂O were added. The aqueous phase was extracted by Et₂O (3 × 40 mL). The organic phase was dried over MgSO₄ and filtered on Celite. The solvent was removed under reduced pressure. The crude product was purified on a silica gel chromatography column (Merck silica gel 60, 15–40 μ m, petroleum ether/AcOEt 8/2). After evaporation under reduced pressure and drying in vacuo, three complexes were obtained: the dinuclear complex 14, 0.122 g, in 44% yield, the mononuclear complex 15, 0.067 g, in 33% yield. The third one recovered in 13% yield corresponded to the decoordination of one of the Cr(CO)3 entities of 14.

Complex 14. ¹H NMR (200 MHz, CDCl₃): $\delta = 7.97$ (s, 2H, H_4), 7.81 (d, J = 7.5, 2H, H_6), 7.44 (m, 2H, H_8), 7.35 (m, 2H, H_7), 7.21 (d, J = 8.3, 2H, H₉), 7.03 (d, J = 12, 2H, H₁₇), 6.33 (d, J =12, 2H, H₁₈), 5.47–5.28 (m, 10H, ArCr), 3.50 (s, 6H, OCH₃). ¹³C NMR (100 MHz, CDCl₃): $\delta = 232.8$ (CO-Cr), 154.3 (C₂), 133.8, 130.3, 129.5, 125.3 (C_1 , C_3 , C_5 , C_{10}), 130.1 (C_4), 128.9 (C_{12}), 128.1 (C_6), 127.8 (C_{13}), 126.8 (C_7), 125.5 (C_9), 125.2 (C_8), 105.4 (C_{14}), 93.5, 93.2, 92.2, 92.0, 91.6 (ArCr), 61.3 (C_{11}). IR (neat): ν (cm⁻¹) 1872, 1958 (CO—Cr). UV (CH₃CN): λ 272 nm (ϵ 86 100 L mol⁻¹ cm⁻¹). UV (CH₂Cl₂): λ 273 nm (ϵ 139 600 L mol⁻¹ cm⁻¹). MS (MALDI-TOF, m/z): calcd for $C_{44}H_{30}Cr_2O_8$, 790.1; found, 813.1 (M + Na⁺), 677.1 (M + Na⁺ — Cr(CO)₃).

2-2'-Dimethoxy-3- η^6 -(ethenylphenyltricarbonylchromium)-3'formyl-1,1'-binaphthyl (15). ¹H NMR (200 MHz, CDCl₃): $\delta =$ 10.60 (s, 1H, CHO), 8.63 (s, 1H, $H_{4'}$), 8.10 (d, J = 8, 1H, $H_{6'}$), 8.02 (s, 1H, H₄), 7.83 (d, J = 8, 1H, H₆), 7.53-7.15 (m, 6H, H₇, H_8 , H_9 , $H_{7'}$, $H_{8'}$, $H_{9'}$), 7.03 (d, J = 12, 1H, H_{18}), 6.35 (d, J = 12, 1H, H₁₇), 5.44–5.30 (m, 5H, ArCr), 3.53 (s, 3H, OCH₃), 3.43 (s, 3H, OCH_{3'}). ¹³C NMR (100 MHz, CDCl₃): $\delta = 232.7$ (CO-Cr), 190.5 (CHO), 156.4, 154.5 (C₂, C₂), 137.0, 133.7, 130.2, 129.9, 129.5, 128.4, 125.8, 124.4 (C_1 , C_3 , C_5 , C_{10} , $C_{1'}$, $C_{3'}$, $C_{5'}$, $C_{10'}$, $C_{14'}$), 131.8, 130.5, 130.4, 129.3, 128.8, 128.2, 127.9, 127.1, 125.9, 125.6, 125.4, 125.3 (C₄, C₆, C₇, C₈, C₉, C₁₂, C₁₃, C₄', C₆', C₇', C₈', C₉'), 105.3 (C₁₄), 93.5, 93.1, 92.1, 91.9, 91.6 (ArCr), 63.0, 61.4 (C₁₁, $C_{11'}$). IR (neat): ν (cm⁻¹) 1689 (CHO), 1877, 1960 (CO-Cr). UV (CH₃CN): λ 271 nm (ϵ 63 700 L mol⁻¹ cm⁻¹). UV (CH₂Cl₂): λ 274 nm (ϵ 114 900 L mol⁻¹ cm⁻¹). 2,2'-Dimethoxy-3- η^6 -(ethenylphenyltricarbonylchromium)-3'ethenylphenyl)-1,1'-binaphthyl (16). ¹H NMR (200 MHz, CDCl₃): $\delta = 7.95$ (s, 1H, H₄ or H₄), 7.91 (s, 1H, H₄ or H₄), 7.80 $(d, J=7, 1H, H_6 \text{ or } H_{6'}), 7.69 (d, J=8, 1H, H_6 \text{ or } H_{6'}), 7.50-7.20$ (m, 11H, H₇, H₈, H₉, H₇, H₈, H₉, Ph), 7.04 (d, J = 12, 1H, H₁₈), 6.95 (d, J = 12, 1H, H_{18}), 6.80 (d, J = 12, 1H, H_{17}), 6.33 (d, J =12, 1H, H₁₇), 5.50-5.20 (m, 5H, ArCr), 3.53 (s, 3H, OCH₃), 3.50 (s, 3H, OCH_{3'}). ¹³C NMR (100 MHz, CDCl₃): $\delta = 232.8$ (CO– Cr), 154.7, 154.5 (C₂, C₂), 137.0, 136.9, 134.0, 133.6, 133.4, 131.0, 130.4, 130.2, 129.5 (C₁, C₃, C₅, C₁₀, C₁, C₃, C₅, C₁₀, C₁₄), 131.3, 131.1, 130.0, 129.9, 129.8, 129.1, 128.9, 128.3, 128.1, 128.0, 127.6, 127.3, 126.7, 126.3, 125.7, 125.1, 124.8 (C₄, C₆, C₇, C₈, C₉, C₁₂, $C_{13},\ C_{4'},\ C_{6'},\ C_{7'},\ C_{8'},\ C_{9'},\ C_{12'},\ C_{13'},\ Ph),\ 105.6\ (C_{14}),\ 93.5,\ 93.2,$ 92.2, 92.0, 91.6 (ArCr), 61.2, 61.1 (C_{11} , $C_{11'}$). IR (neat): ν (cm⁻¹) = 1888 (CO-Cr), 1964 (CO-Cr). MS (MALDI-TOF, m/z): calcd for $C_{41}H_{30}CrO_5$, 654.1; found, 677.3 (M + Na⁺), 541.2 (M + Na⁺ Cr(CO)₃).

Synthesis of 2,2'-Dimethoxymethyl-3- η^6 -(ethenylphenyltricarbonylchromium)-1,1'-binaphthyl (17). Under N₂, compound 13 (0.152 g, 0.27 mmol) prepared in a way similar to that described in the literature 18b was dissolved in 15 mL of THF. BuOK (c =1.0 mol L^{-1} in THF, 0.324 mL, 0.324 mmol) was slowly added, and the mixture was stirred for 1 h at room temperature. Compound 2a was then added at once to the orange solution of ylide, and the mixture was refluxed for 4 h. After being cooled at room temperature, the solution was hydrolyzed with 20 mL of an aqueous saturated ammonium chloride solution and extracted with dichloromethane (2 \times 20 mL). The joined organic layers were washed with 20 mL of water, dried over anhydrous magnesium sulfate, filtered through Celite, and the solvent was evaporated under reduced pressure. The resulting yellow oil was purified by a silica gel chromatography column (15–40 μ m, eluent EP/ethyl acetate: from 100/0 to 86/14 by portions of 50 mL and increment of 2%). Two compounds were separated corresponding to 17-Z (66%, 0.109 g) and 17-E (15%, 0.025 g), respectively, as a yellow and an orange solid.

Complex 17-Z. MS (FAB, m/z): calcd, 612.1; found, 612.1. 1 H NMR (200 MHz, CDCl₃): 2.86 (s, 3H, H₂₀), 3.22 (s, 3H, H₂₀), 4.66 (d, J = 5.8 Hz, 1H, H₁₉), 4.76 (d, J = 5.8 Hz, 1H, H₁₉), 5.09 (d, J = 7.0 Hz, 1H, H₁₉), 5.18 (d, J = 7.0 Hz, 1H, H₁₉), 5.28–5.37 (m, 3H, H₁₃, H₁₄, H₁₅), 5.47 (d, J = 6.3 Hz, 2H, H₁₂, H₁₆), 6.36 (d, J = 12.2 Hz, 1H, H₁₇ or H₁₈), 7.06 (d, J = 12.2 Hz, 1H, H₁₈ or H₁₇), 7.21–7.45 (m, 6H, H₇, H₈, H₉, H₇, H₈', H₉'), 7.63 (d,

Synthesis of Ferrocenylmethanol.²² A solution of ferrocenecarboxaldehyde (1.07 g, 5.0 mmol) in methanol (50 mL) was cooled at 0 °C. NaBH₄ (0.95 g, 25 mmol) dissolved in an aqueous solution of sodium hydroxide (2 N) was then added via a canula, and the resulting mixture was stirred and allowed to warm to room temperature overnight. The methanol was evaporated with vigorous stirring, and the resulting aqueous solution was extracted with diethyl ether (3 × 30 mL). The organic layer was washed with water (2 × 30 mL), dried over anhydrous MgSO₄, filtered through Celite, and evaporated under reduced pressure. The treatment led to the ferrocenylmethanol in quantitative yield. ¹H NMR (200 MHz, CDCl₃): 1.65 (t, J = 6.1 Hz, 1H, OH), 4.24 (s, 7H, C₅H₅ and C₅H₄), 4.29 (m, 2H, C₅H₄), 4.37 (d, J = 6.1 Hz, 2H, CH₂). ¹³C NMR (50 MHz, CDCl₃): 61.2 (C₅H₄), 68.4–68.9 (C₅H₄), 68.7 (C₅H₅), 88.7 (CH₂).

Synthesis of (Ferrocenylmethyl)triphenylphosphonium Bromide (18).²² Ferrocenylmethanol (0.432 g, 2.0 mmol) was dissolved in CH₂Cl₂ (10 mL) with triphenylphosphonium hydrobromide, PPh₃·HBr^{18b} (0.618 g, 1.8 mmol), in the presence of activated molecular sieve (4 Å). The solution was refluxed during 1 h. After being cooled at room temperature, the mixture was filtered under N₂ and dry diethyl ether was added until persistence of a yellow precipitate. After decanting, the liquid layer was removed with a syringe, and the solid was washed twice with dry diethyl ether (10 mL). The (ferrocenylmethyl)triphenylphosphonium bromide, 18, was obtained in 80% yield (0.779 g). For C₂₉H₂₆BrFeP M = 541. ¹H NMR (400 MHz, CDCl₃): 3.94 (sb, 2H, C₅H₄), 4.02 (sb, 2H, C₅H₄), 4.33 (s, 5H, C₅H₅), 5.05 (d, J = 11.7 Hz, 2H, CH₂), 7.60–7.73 (m, 15H, C₆H₅). ¹³C NMR (100 MHz, CDCl₃): 31.3 (d, J =

^{(22) (}a) Kalita, D.; Morisue, M.; Kobuke, Y. New J. Chem. **2006**, *30*, 77. (b) Thomas, K. R. J.; Lin, J. T.; Wen, Y. S. J. Organomet. Chem. **1999**, 575, 301.

48 Hz, CH₂), 69.2–71.0 (C₅H₄), 70.4 (C₅H₅), 70.9 (d, J=2 Hz, C₅H₄), 118.5 (d, J=85 Hz, C_{Ph}–P⁺), 130.5 (d, J=12.0 Hz, C_{Ph}–P⁺), 134.7 (d, J=10 Hz, C_{Ph}–P⁺), 135.3 (d, J=3.5 Hz, C_{Ph}–P⁺). Anal. Calcd for C₂₉H₂₆PFeBr: C, 61.10; H, 5.60. Found: C, 61.18; H, 5.51. MS (MALDI-TOF, m/z): calcd for C⁺, 461; found, 461 C⁺ (M – Br), 1002 (M + 1 + C⁺).

Synthesis of 2,2'-Dimethoxymethyl-3-ferrocenylethenyl-1,1'binaphthyl (19-E and -Z). (Ferrocenylmethyl) triphenylphosphonium bromide, 18a 18 (0.171 g, 0.50 mmol), was dissolved under N₂ in THF (15 mL). The solution was cooled at 0 °C, and a solution of 'BuOK in THF ($c = 1.0 \text{ mol } L^{-1}, 0.60 \text{ mL}, 0.60 \text{ mmol}$) was slowly added. The mixture was stirred at 0 °C for 1 h. In another flask, compound 2a (0.201 g, 0.50 mmol) was dissolved in THF (10 mL). The suspension was cooled at −78 °C. The red solution of ylide was then cooled at the same temperature, and the suspension of 2a was added via a canula. The resulting mixture was stirred at -40 °C. After 2 h, the solution was hydrolyzed with 20 mL of an aqueous saturated ammonium chloride solution at room temperature and extracted twice with 20 mL of dichloromethane. The joined organic phases were washed with 20 mL of water, dried over anhydrous magnesium sulfate, filtered through Celite, and the solvents evaporated under reduced pressure. The residue was purified by silica gel chromatography column (15–40 μ m, eluent EP/Et₂O: from 100/0 to 90/10 by portions of 50 mL and increment of 2%). A mixture of red complexes 19-Z and 19-E that could not be separated by silica gel chromatography column was obtained in 45% yield, 132 mg (Z/E: 3/1, NMR ratio). IR (neat): ν (cm⁻¹) 1624 (C=C: C_{17} - C_{18}). MS (FAB m/z): calcd for $C_{36}H_{32}FeO_4$, 584.2; found, 584.2 (M⁺). Anal. Calcd for C₃₆H₃₂FeO₄: C, 73.95; H, 5.52. Found: C, 74.14; H, 5.61.

19-Z. ¹H NMR (400 MHz, CDCl₃): 2.53 (s, 3H, H₂₀), 2.98 (s, 3H, H₂₀), 4.04 (s, 5H, Cp), 4.13 (m, 2H, H₁₂ and H₁₅ or H₁₃ and H₁₄), 4.19 (m, 2H, H₁₃ and H₁₄ or H₁₂ and H₁₅), 4.65 (d, J = 5.7 Hz, 1H, H₁₉), 4.71 (d, J = 5.7 Hz, 1H, H₁₉), 4.94 (d, J = 6.8 Hz, 1H, H₁₉), 5.07 (d, J = 6.8 Hz, 1H, H₁₉), 6.40 (d, J = 11.9 Hz, 1H,

 H_{17} or H_{18}), 6.62 (d, J = 11.8 Hz, 1H, H_{18} or H_{17}), 7.07–7.29 (m, 6H, H₇, H₈, H₉, H₇, H₈, H₉), 7.50 (d, J = 9.1 Hz, 1H, H₃), 7.69 $(d, J = 8.3 \text{ Hz}, 1H, H_{6'}), 7.78 (d, J = 8.1 \text{ Hz}, 1H, H_{6}), 7.87 (d, J)$ = 9.1 Hz, 1H, $H_{4'}$), 7.93 (s, 1H, H_4). ¹³C NMR (50 MHz, CDCl₃): $55.9 (C_{20}), 56.2 (C_{20'}), 69.3 (C_{16}), 69.4-69.7 (C_{12}-C_{15} \text{ and } C_{13}-C_{14}),$ $95.1\ (C_{19'}),\, 98.8\ (C_{19}),\, 116.9\ (C_{3'}),\, 121.5\text{-}124.1\text{-}124.9\text{-}125.7\text{-}125.9\text{-}$ 129.5-130.7-131.3-131.1-132.1-133.0-133.3-134.1 -134.2 (C₁, C₃, $C_5, C_7, C_8, C_9, C_{10}, C_{11}, C_{1'}, C_{5'}, C_{7'}, C_{8'}, C_{9'}, C_{10'}), 123.5 (C_{17} \text{ or }$ C₁₈), 127.8 (C₆), 127.9 (C₆), 129.4 (C₁₈ or C₁₇), 129.6 (C₄), 129.8 $(C_{4'})$, 151.9 (C_2) , 152.9 $(C_{2'})$. **19-E.** ¹H NMR (400 MHz, CDCl₃): 2.68 (s, 3H, H_{20}), 2.98 (s, 3H, $H_{20'}$), 4.08 (m, 2H, H_{12} and H_{15} or H_{13} and H_{14}), 4.10 (s, 5H, H_{16}), 4.10 (m, 2H, H_{12} and H_{15} or H_{13} and H_{14}), 4.57 (d, J = 5.7 Hz, 1H, H_{19}), 4.62 (d, J = 5.7 Hz, 1H, H_{19}), 4.93 (d, J = 6.8 Hz, 1H, H_{19}), 5.07 (d, J = 6.8 Hz, 1H, H_{19}), 7.05 (d, J = 15.9 Hz, 1H, H_{17} or H_{18}), 7.07–7.29 (m, 6H, H_7 , H_8 , $H_9, H_{7'}, H_{8'}, H_{9'}$, 7.51 (d, J = 9.1 Hz, 1H, $H_{3'}$), 7.69 (d, J = 8.3Hz, 1H, $H_{6'}$), 7.82 (d, J = 8.1 Hz, 1H, H_{6}), 7.88 (d, J = 9.1 Hz, 1H, H₄'), 8.08 (s, 1H, H₄). ¹³C NMR (50 MHz, CDCl₃): 55.9 (C₂₀), 56.7 ($C_{20'}$), 68.9 (C_{12} – C_{15} and C_{13} – C_{14}), 69.3 (C_{16} , C_{12} – C_{15} and $C_{13}-C_{14}$), 95.0 ($C_{19'}$), 99.1 (C_{19}), 116.8 ($C_{3'}$), 121.5-124.1-124.9-125.7-125.9-129.5-130.7-131.3-131.1-132.1-133.0-133.3-134.1-134.2 (C_1 , C_3 , C_5 , C_7 , C_8 , C_9 , C_{10} , C_{11} , $C_{1'}$, C_5 , C_7 , C_8 , C_9 , $C_{10'}$), 121.3 (C_{17} or C_{18}), 127.8 (C_{6}), 127.9 ($C_{6'}$), 128.9 (C_{17} or C_{18}), 129.7 $(C_4, C_{4'}), 151.1 (C_2), 152.9 (C_{2'}).$

Acknowledgment. We thank Céline Chadefaux for partial synthesis of complexes **14–16** and the CNRS for financial support.

Supporting Information Available: Tables of crystal data, atomic coordinates, and bond distances and angles for complexes **8a** and **17Z**. Crystallographic data as CIF files. This material is available free of charge via the Internet at http://pubs.acs.org.
